RE: Towing a Vehicle with an HWH Air Leveling System

TOWING A VEHICLE WITH AN HWH AIR LEVELING SYSTEM

On any motor coach with an HWH Air Leveling system, the vehicles air bags will not inflate as long as the ignition key is in the "OFF" position. Consequently, if the vehicle should ever require emergency towing, the ignition key must be left in the "ON" position in order to build and store air in the suspension. In addition, the ignition must be left in the "ON" position when adjusting the height control valves.

We recommend that a warning label be placed in a strategic location where it is likely to be seen by tow vehicle operators.

Please contact HWH Corporation at (800) 321-3494 for technical advice or assistance.
File in AIR LEVELING SYSTEMS section.
